

# First air-shower measurements with the prototype station of the IceCube surface enhancement

Hrvoje Dujmović, Alan Coleman, Marie Oehler  
ICRC 2021

- In the coming years, IceCube's cosmic-ray capabilities will be enhanced by adding scintillators and radio antennas to the surface array
- The design of the Encacement is being tested with a prototype station deployed to the Pole in Jan. 2020
- **First cosmic-ray air-showers with the prototype station have been measured**
- Basic event reconstructions are performed on the scintillator, radio and IceTop data individually
  - The results agree with each other and the station seems to be performing as expected!
- Improved reconstructions and additional cross-checks are being worked on
