

Neutrino direction and flavor reconstruction using deep neural networks

Sigfrid Stjärnholm
Oscar Ericsson
Christian Glaser

ICRC 2021

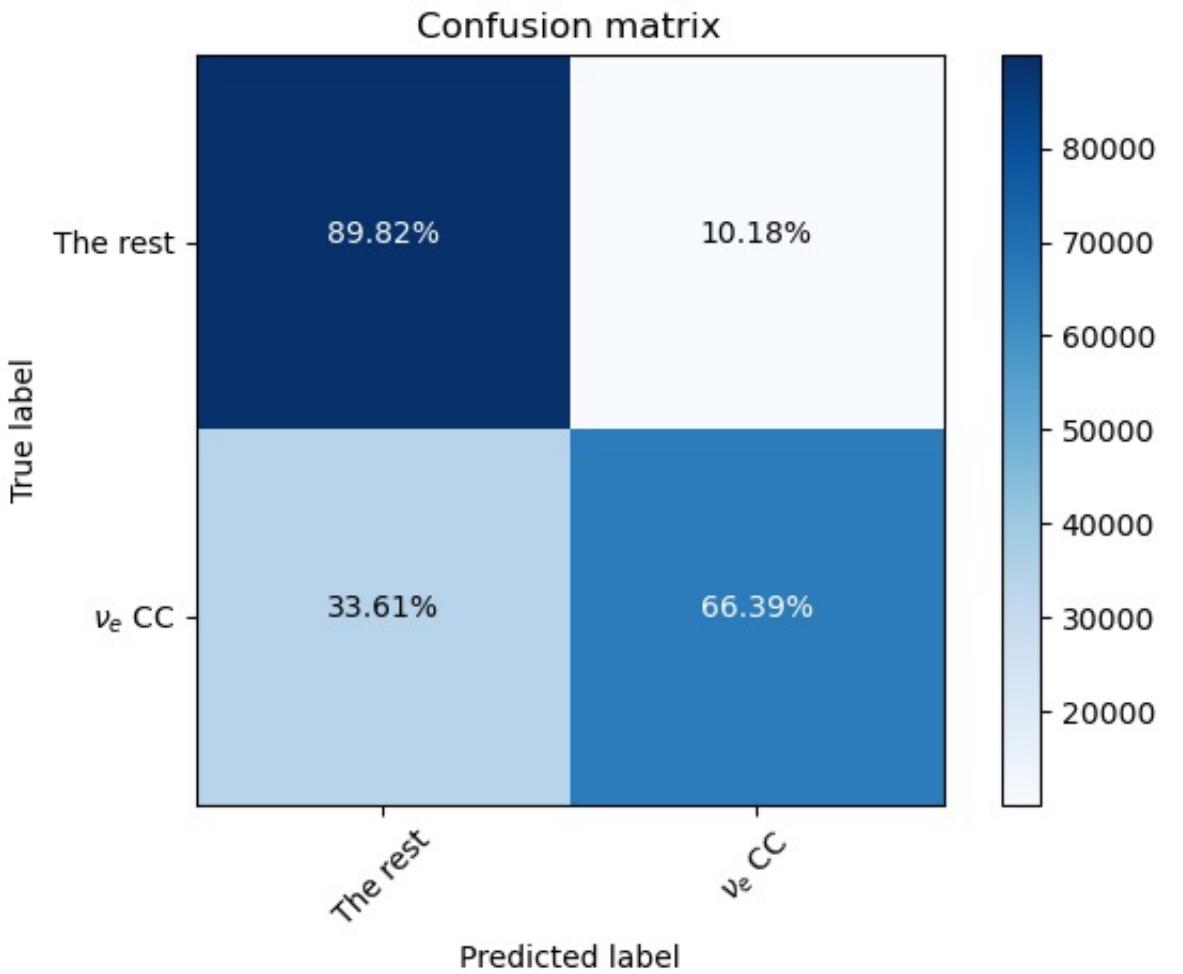

Background

- Neutrino interaction with matter → Radio pulse (Askaryan emission)
- Radio technique for ultra high energy neutrino astronomy has shown great promise...
- Need reconstruction methods
- Great potential use case for neural networks!

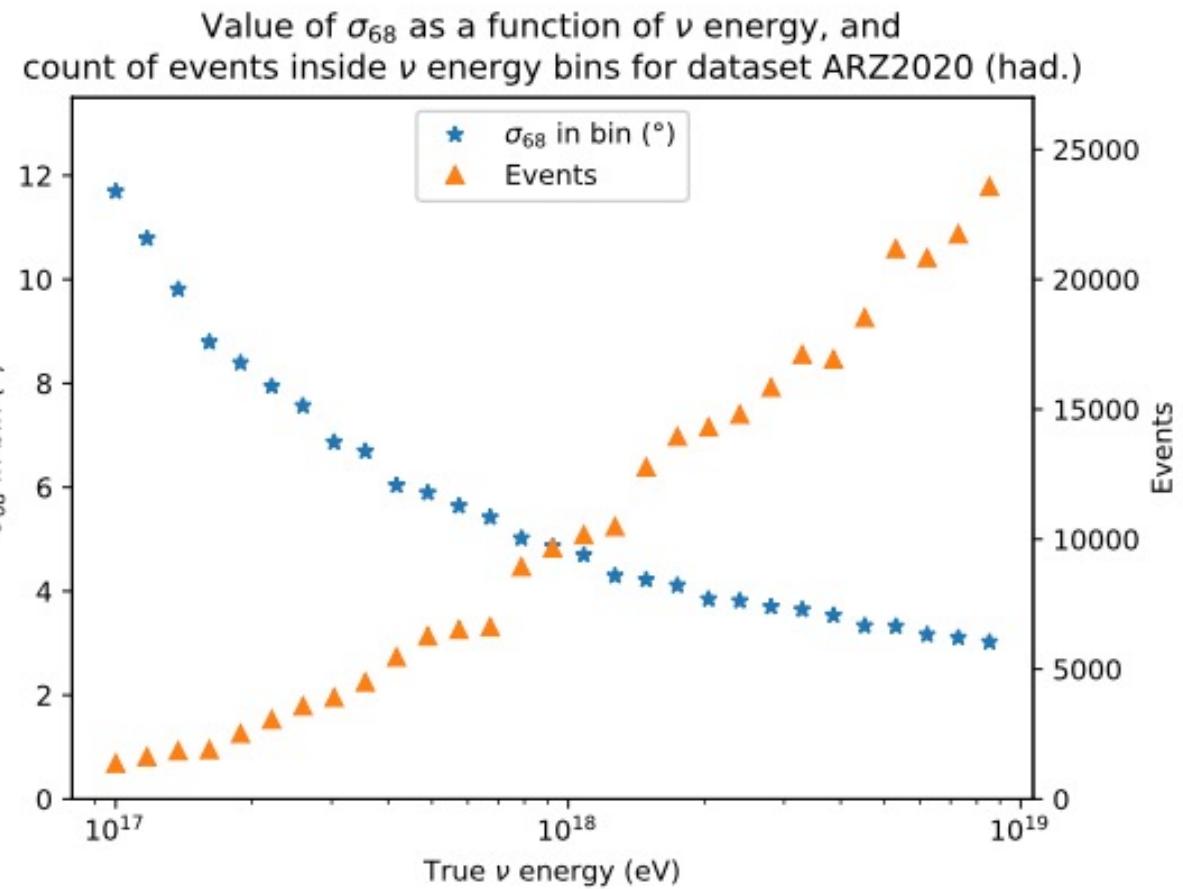

Flavor reconstruction

- Simulated signals from neutrinos with energies $10^{17} < E_\nu < 10^{19}$
- Tell ν_e -CC interactions from the rest.
- ~90% accuracy on non- ν_e -CC events, ~66% accuracy on ν_e -CC events.

Direction reconstruction

- Results: 68 % interval
 - 4° space angle error
- Low energy events more difficult to reconstruct.
